# 1 Introduction

## 1.1 Purpose

The purpose of this project is to deliver the Requirement Analysis and Specification Document (RASD) for the “Students&Companies” (S&C) system-to-be. It aims to optimize the process of matching university students seeking internships with companies offering them. It acts as a bridge, ensuring that both parties can efficiently find and connect with opportunities that align with their needs and expectations. The ultimate goal of the S&C platform is to simplify and enhance the entire internship process, from the initial search to the final selection and beyond. By leveraging technology for intelligent recommendations and providing tools to manage interactions, S&C aims to create a seamless and productive experience for both students and companies. This ensures better matches, smoother communication, and continuous feedback, leading to higher satisfaction and more successful internships.

### 1.1.1 Goals

These are the goals that we want to achieve by implementing our software:

- G1. A student should be able to search for internships from various companies.
- G2. A student should receive recommendations about new internships based on several mechanisms such as keyword searching or statistical analysis.
- G3. Companies should be able to contact the applying students in order to accept or decline their application.
- G4. A student should be able to track and monitor the execution and the outcomes of the selection process.
- G5. Companies should be able to monitor the ongoing internships along with complaints, problems and feedback by the students.
- G6. Companies should get informed about available student CVs based on their needs.
- G7. Companies should be able to interview students through structured questionnaires.

## 1.2 Scope

According to the World and Machine paradigm, introduced by M. Jackson and P. Zave, we can identify the Machine as the System to be developed and the environment, in which S&C will be used, as the World. The separation between these two concepts allows us to classify the entire phenomena in three different types.

### **1.2.1 World Phenomena**

- WP1. Student wants to insert CV.
- WP2. Company HR wants to insert a new internship.
- WP3. Company interviews a student.
- WP4. Company has decided the winner/s of the internship matchmaking.
- WP5. Student wants to complain about an internship.

### **1.2.2 Shared Phenomena**

#### **Controlled by the Machine**

- SPM1. Recommendation mechanism informs a student about interesting internships.
- SPM2. Recommendation mechanism suggests CVs to the companies about an internship.
- SPM3. Internship page provides information to the Student .
- SPM4. The system notifies the students if their status of the application changes.

#### **Controlled by the World**

- SPW1. Student inserts CV inside the website.
- SPW2. Student sends application for an internship.
- SPW3. Student cancels an application.
- SPW4. Student searches for internships by typing keywords.
- SPW5. Company creates a new questionnaire for the internship in order to interview students.
- SPW6. Student compiles questionnaires sent by the company.
- SPW7. Company grades the a student's answers of a questionnaire.
- SPW8. Student accesses to the monitoring page of the internship.
- SPW9. Company accesses to the monitoring page of the internship.
- SPW10. Student writes a complaint about the internship they are experiencing.
- SPW11. Student reviews the internship after finishing it.
- SPW12. Company reviews the student internship.

## 1.3 Definitions, Acronyms, Abbreviations

### 1.3.1 Definitions

- **URL:** Uniform Resource Locator, it is the address of a unique resource on the internet.

### 1.3.2 Acronyms

- **S&C:** Students&Companies
- **HR:** Human Resources
- **CV:** Curriculum Vitae

### 1.3.3 Abbreviations

- **G<sub>n</sub>:** the n-th goal
- **WP<sub>n</sub>:** the n-th world phenomenon
- **SPM<sub>n</sub>:** the n-th shared phenomenon controlled by the Machine
- **SPW<sub>n</sub>:** the n-th shared phenomenon controlled by the World
- **R<sub>n</sub>:** the n-th functional requirement
- **D<sub>n</sub>:** the n-th domain assumption
- **UC<sub>n</sub>:** the n-th use case

## 1.4 Revision History

- **Version 1.0** (Nov. 9, 2024)

## 1.5 Reference Documents

- **Assignment Document** (Assignment RASD&DD A.Y. 2024-2025)
- **Course Slides** (Software Engineering 2 A.Y. 2024-2025)

## 1.6 Document Structure

1. **Introduction:** it aims to give a brief description of the project. In particular it's focused on the reasons and the goals that are going to be achieved with its development.
2. **Overall Description:** it is an high-level description of how the system works with a detailed explanation of the phenomena that involve the world, the machine or both, there is also the domain description with its assumptions.

3. **Specific Requirements:** in this section there is a detailed analysis of the requirements needed to achieve the goals. Moreover, it contains more information useful for developers (i.e constraints about HW and SW).
4. **Formal analysis:** it's a formal description of the world phenomena by the means of Alloy.
5. **Effort spent:** it shows the time spent to realize this document organized by section.
6. **References:** it contains the references to any documents and software used to write this paper.

## 2 Overall Description

### 2.1 Product Perspective

#### 2.1.1 Scenarios

1. **User does a proactive search**

Bob wants to search for an internship abroad to further expand his knowledge about Neural Networks. He also wants to learn Spanish so he's looking for an internship in Spain. He remembers of S&C, a web app that helps university students looking for internships provided by companies. He opens his browser, types the URL of the site and, after logging in, he goes to the Recommendation System form to search for interesting internships. He checks keywords like "Machine Learning", "Neural Networks" and "Spain" and submits his search. The system shows the best options available matching his requests. Bob reads carefully every internship and chooses the ones he thinks are the best by clicking on the "Apply" button. The company gets notified for Bob's application.

2. **Company posts a new available internship**

OpenAI is looking for new students who might want to learn new subjects and expand their knowledge about Deep Neural Network and wants to advertise its new internship in San Francisco, California. The company HR Mark knows there exists a new website called S&C that allows companies to promote new internships. He searches of the website and signs up as a company profile. He then goes to the form about creating a new internship and fills up all the parameters (ex. tasks, technologies, benefits...).

3. **Automated Recommendation System**

Bob is a student who is interested in doing an internship but he doesn't have much knowledge about the best options for him. He knows that S&Cs is able to suggest him interesting internships based on his CV, so he goes to the User Settings page and inserts his CV as a PDF file. After saving his settings, he goes back to the Home page and sees that the website suggested him some internship about Web Developing, since Bob had a part-time job as a Web Developer. Similarly the website, after analyzing Bob's CV, will show Bob as a good candidate in the Main page of the companies which are looking for a web developer.

4. **Selection Process and Interview Management**

Julie, as many students looking for a great offer, applied for the internship offered by OpenAI, so it had a great demand. The problem is that there are only 4 spots even if more than 2000 students applied. The deadline for the application has exceeded and the HR has to choose among more than 2000 students! Luckily S&Cs supports the selection process by enabling the company to interview students and rank them

by posting questionnaires. After answering the questionnaire, Julie can track the status of her application by going to the Status page. Here she can see that the selection process is still on-going. The HR can see the ranking of the students based on the questionnaires the students have completed and notices that Julie is in first place. The company then decides the 4 students to be selected and Julie is one of them, so the HR selects and adds them to the internship. Julie enters the website and sees a notification from OpenAI about being accepted for the internship.

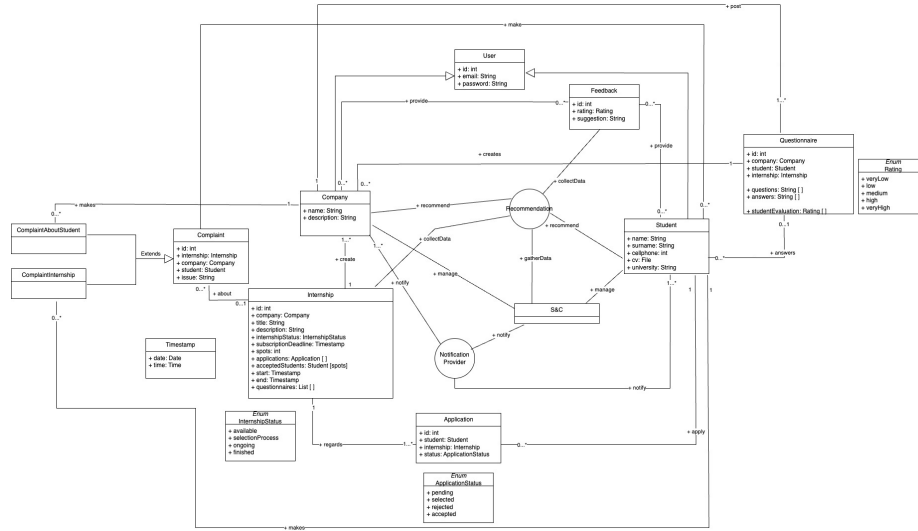

**5. Internship Monitoring**

After OpenAI internship has started both Julie and OpenAI can monitor its state by going to the internship page, which displays the ongoing activities, the duration of the internship and other important information. Both parties can add complaints through and such complaints can be seen on the internship page.

**6. Feedback and Suggestions**

After Bob has finished his internship for Google, the platform asks him to give a feedback about the work experience and the company by compiling a form with ratings about several aspects (from 1 to 5 stars) and, if wanted, by writing some suggestions so that future students will be able to check the reviews of the internship and decide. The company can give a review about the behavior of Bob during the internship as well. So, if someone will eventually check Bob's user page, the internships history and ratings will be shown.

## 2.1.2 Domain Class Diagram

Domain Class Diagram

## 2.1.3 State Diagrams

The subsequent section details the principal elements of the Students&Companies system and their progression through different phases. For this purpose, some State Diagrams are proposed.

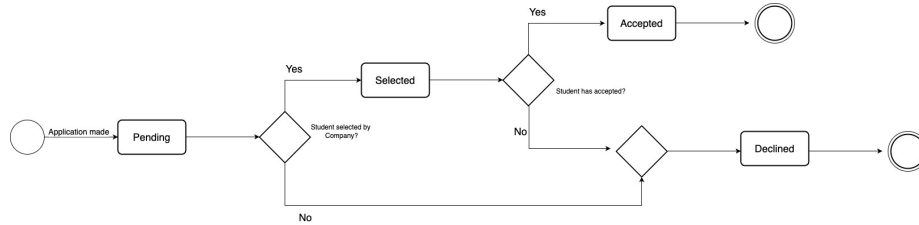

### Internship

Internship State Diagram

The diagram in question outlines the potential phases of an Internship. It is created by a company and enters the *Available* phase, allowing students to make an application. After the subscription deadline has been reached, the system transitions the internship to the *Selection Process* phase, in which the company has to select the students who will participate to the internship. Upon the resolution of these selections, the system sets the internship to *Ongoing*, meaning that students are attending the internship. After the end has been reached, it is set to *Finished*.

## Application

Application State Diagram

The application is created by a student who wants to apply for an Internship. The first state is *Pending* since it must be evaluated by the company with respect to all other applications. If the student has been selected, the state is set to *Selected* and the student has 3 days (72 hours) to confirm his application, otherwise it is set to *Declined*.

## 2.2 Product Functions

### 2.2.1 Requirements

#### 1. Sign Up and Login

This function will be available for all users. The sign up feature allows users to register themselves on the platform, by typing their email address (it'll be used as username) and by choosing a password. After successfully registering to the system, it'll be asked to insert personal information such as name, surname, birthdate and their phone number (mandatory). The login feature allows already registered users to access their personal page and manipulate their data.

#### 2. Insert CV

This function will be available for students only. In order to be allowed to search for internships, the CV insertion is a fundamental step. The system prevents a student from doing anything until they successfully upload their CV on the website (a PDF version of the file is required). After that, the student will be allowed to use the platform freely.

#### 3. Manage applications

This function will be available for students only. In order to manage their own applications for selected internships, every student can access a personal dashboard to apply for new internships, monitor ongoing internships applications status or cancel an application.

#### 4. Insert an internship

This function will be available for companies only. From companies side, one of the most important tasks will be the insertion of new internships

offers. The company dashboard will allow the authorized personnel to add new offers, by inserting a name, some keywords, the duration and (potentially) the compensation.

#### 5. **Manage internships**

This function will be available for companies only. Companies HRs will have to manage the already existing internships, by removing expired offers or by editing expiration dates for applications. Furthermore, HRs should be able to change descriptions of the existing offers, add new keywords (if needed) and specify a compensation (if it wasn't already specified).

#### 6. **Recommendation system**

This function will be available for all users. Recommendation system will allow users to receive suggestions based on statistical analysis, specific keywords, ratings. Students with good reviews will be suggested to companies in order to be contacted for an internship opportunity. On the other side, this functionality will notify students about internships of their interest based on their preferences expressed on the website.

## 2.3 User Characteristics

In the S&C platform, users are people who own a device able to connect to the internet, for example a smartphone, a tablet or a personal computer and have a browser which is used to type the S&C URL. They can be either Students or Companies, each with distinct roles and motivations.

- **Students:** they join S&C to search for interesting internships in order to enhance their skills and experiences in the working environment. To use the all the platform's services, they need to load their CV in order to have personalized recommendations based on their assets. After they have applied for internships, they will be notified
- **Companies:** they join S&C to gain easy access to student talent, reduce hiring costs, build a future workforce, and enhance their brand as an employer of choice. The platform also monitors the selection process and offers data-driven insights, helping companies remain competitive in attracting the right candidates while contributing to students' professional development.

## 2.4 Assumptions, Dependencies, and Constraints

### 2.4.1 Domain Assumptions

- D1. Both students and company HRs must have an internet connection.
- D2. CVs of the students are written in English.

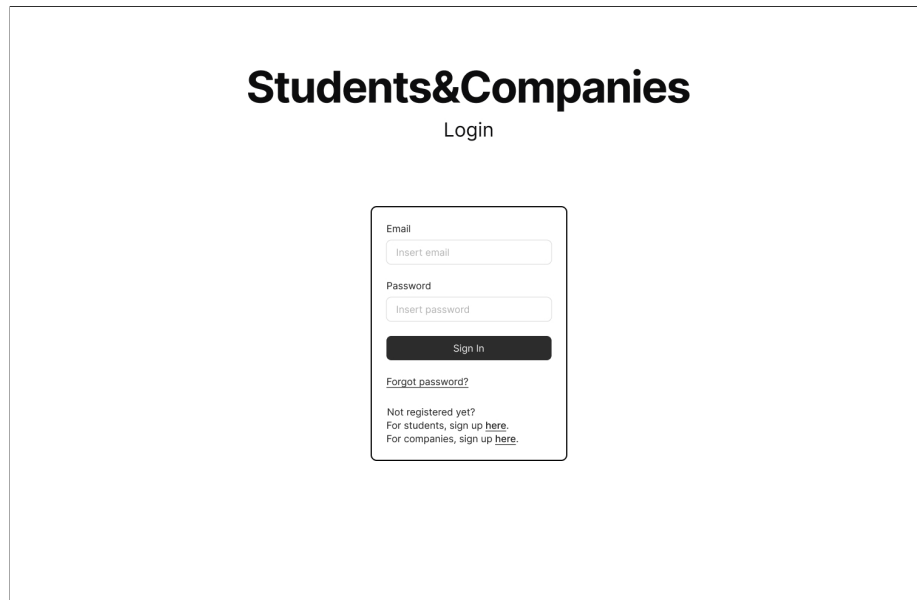

- D3. Students who have been selected for the internship have up to 3 days to decide either to accept it or not.
- D4. Only HRs are delegated to access the website on behalf of the company's name.
- D5. Every student by uploading their CV automatically includes a phone number and an email address for possibly being contacted by HRs.
- D6. The feedback provided by students are assumed to be honest and transparent about their experiences, in order not to make the matchmaking system misleading.
- D7. It is assumed that all internships posted on the platform comply with local labor laws and regulations, including rules regarding the minimum duration of internships, working conditions, and compensation (if applicable).
- D8. Student types the correct name of the internship when searching it.
- D9. Information written in student's CV truly represents his skills and goals.

## 3 Specific Requirements

### 3.1 External Interface Requirements

#### 3.1.1 User Interfaces

In this section the UI of the platform is presented: the main functions by students or companies are shown through some mock-ups that indicatively represent the actual interaction.

The mock-up shows a login page for 'Students&Companies'. The title 'Students&Companies' is centered at the top in a large, bold, black font. Below it, the word 'Login' is centered in a smaller, regular black font. The main content is a white rectangular box with a thin black border. Inside this box, the label 'Email' is above a text input field with the placeholder text 'Insert email'. Below that, the label 'Password' is above a text input field with the placeholder text 'Insert password'. Under the password field is a dark gray button with the text 'Sign In' in white. Below the button is a link labeled 'Forgot password?'. At the bottom of the box, there is text that says 'Not registered yet?' followed by two lines: 'For students, sign up [here](#).' and 'For companies, sign up [here](#).'

### **3.1.2 Hardware Interfaces**

In order to use the platform, both students and companies must be able to access it through a generic web browser. So a laptop or a desktop computer it's obviously the mandatory choice for every user.

### **3.1.3 Software Interfaces**

The system must integrate a Notification Provider through which it's possible to notify about any important information or upcoming news. Along with that, in order to give proper recommendations to students and companies, a Recommendation System needs to be implemented as well.

### **3.1.4 Communication Interfaces**

In order to properly work, the platform obviously requires an internet connection since it's hosted on a website and data is going to be exchanged.

## **3.2 Functional Requirements**

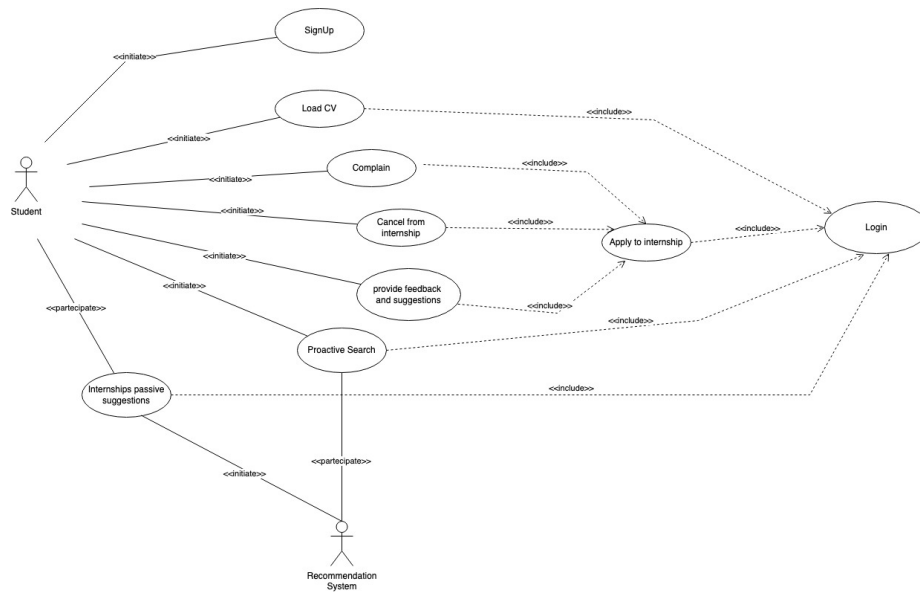

- R1. The system allows students to sign up.
- R2. The system allows companies HR to sign up.
- R3. The system allows registered students to log in.
- R4. The system allows registered HRs of companies to log in.
- R5. The system allows students to insert their CV.
- R6. The system allows users to insert and manipulate personal information.
- R7. The system allows companies to create new available internships.
- R8. The system allows companies to set a deadline for available internships.
- R9. The system automatically prevents students from applying for expired internships.
- R10. The system allows students to apply for an available internship.
- R11. The system allows students to cancel an application to an internship.
- R12. The system allows students to proactively search for internships by using keywords.
- R13. The Recommendation system suggests available internships to students based on statistical analysis.
- R14. The Recommendation system recommends students to companies based on students' CVs.

- R15. The system allows companies to request students to apply for a given internship.
- R16. The system allows students to accept or deny requests for internships received from companies.
- R17. The system allows companies to publish structured questionnaires on the internship page.
- R18. The system allows students to compile the questionnaires proposed by the company.
- R19. The system ranks students who applied to the internship based on the results of the questionnaires.
- R20. The system allows companies to choose for a maximum number of students to be accepted.
- R21. The system allows both students and companies to provide feedback about each other and to suggest potential improvements after the internship is over.
- R22. The system notifies students whether their application for an internship has been accepted or declined.
- R23. The system allows students and companies to complain about problems during internships.
- R24. The system allows companies to check ratings of students applied to one internship.

### 3.2.1 Use Cases Diagrams

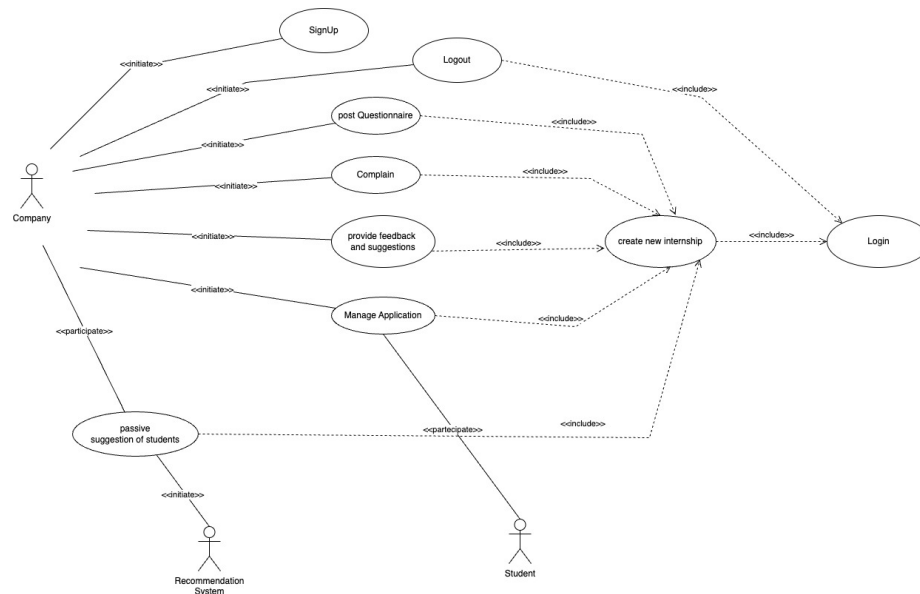

In the following are provided the use case diagrams deduced from the scenarios reported in paragraph 2.1.1. They help identify the actors interacting with the system and their role within each use case.

| R15. The system allows companies to request students to apply for a given internship.                    |                                                                                                                                                      |
| R17. The system allows companies to publish structured questionnaires on the internship                  |                                                                                                                                                      |
| R19. The system ranks students who applied to the internship based on the results of the questionnaires. |                                                                                                                                                      |

### 3.3 Performance Requirements

The system should guarantee a decent performance in order to be reliable for all users. In requirements, this means that the delay between interactions and responses shouldn't be greater than a couple seconds overall, assuming a stable internet connection.

### 3.4 Design Constraints

#### 3.4.1 Standards compliance

About the privacy of data, the system should rely on the guidelines provided by the General Data Protection Regulation (GDPR).

### **3.4.2 Hardware limitations**

The hardware should rely on a Wi-Fi or Ethernet connection to be able to connect to the website.

## **3.5 Software System Attributes**

### **3.5.1 Reliability**

The system must provide continuous and dependable service with minimal failures. This can be achieved by implementing automated monitoring and logging to track system health and developing thorough testing procedures to identify and resolve potential failure points before deployment.

### **3.5.2 Availability**

The system must ensure continuous operation, minimizing downtime to maintain high availability for users, aiming for 99.95% availability through redundancy and failover mechanisms.

### **3.5.3 Security**

The system must protect data and operations from unauthorized access, data breaches, and other security threats, maintaining confidentiality, integrity, and availability.

### **3.5.4 Maintainability**

The system should be easy to update, repair, and improve with minimal effort. Code should be well-documented, modular, and organized to allow straightforward modification.

### **3.5.5 Portability**

The system should be easily deployable across multiple platforms (e.g., Windows, macOS, Linux) and environments (e.g., cloud and on-premises). The platform is developed through a web page in order to be executed on a generic web browser.

## 4.3 Examples

### 4.3.1 First example

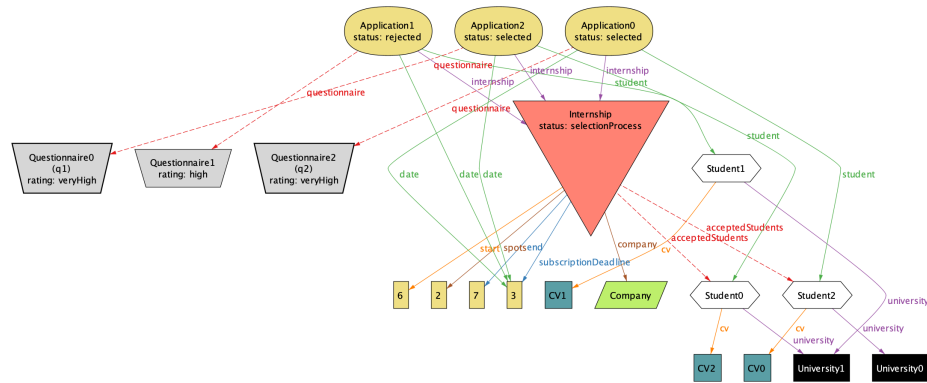

```

1 // Verifying that students with veryHigh rating are accepted
  for the internship
2 pred show [] {
3     #Student = 3
4     #Company = 1
5     #Internship = 1
6     #Application = 3
7     some disj q1, q2: Questionnaire | (q1.rating =
8         veryHigh and q2.rating = veryHigh)
9     one i: Internship | i.spots = 2
10 }
11 run show for 10

```

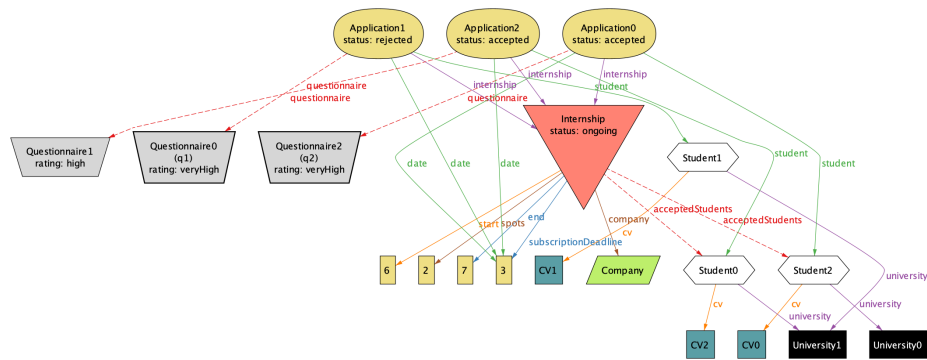

State 0

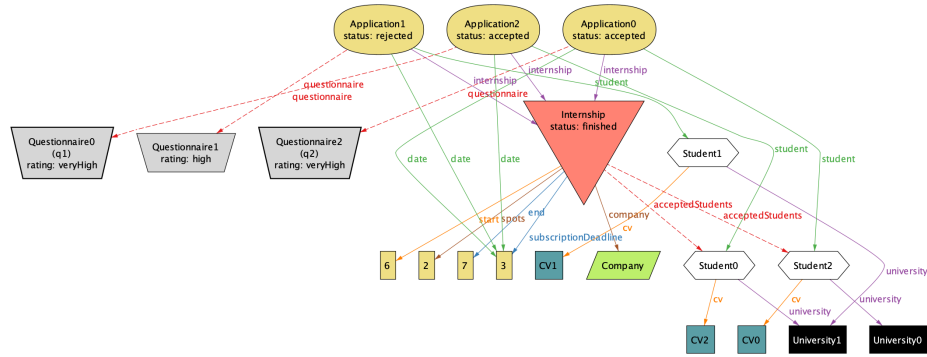

State 1

State 2

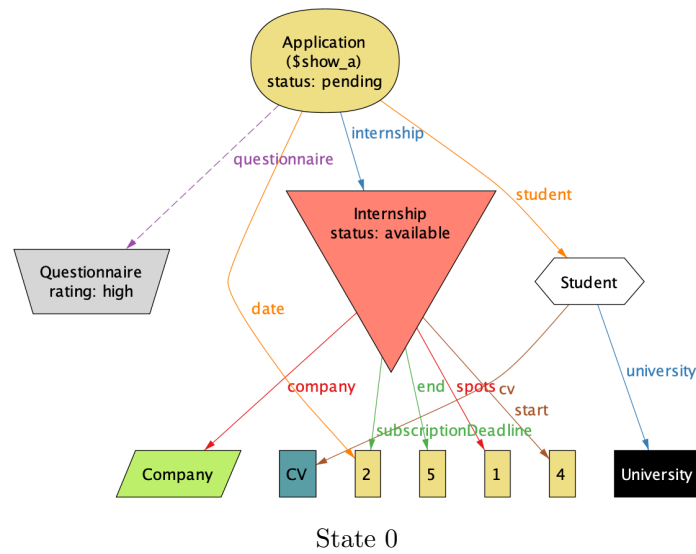

State 3

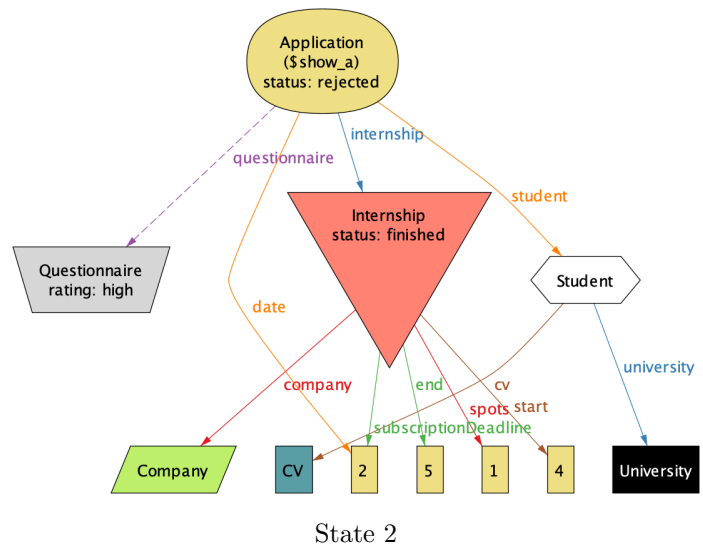

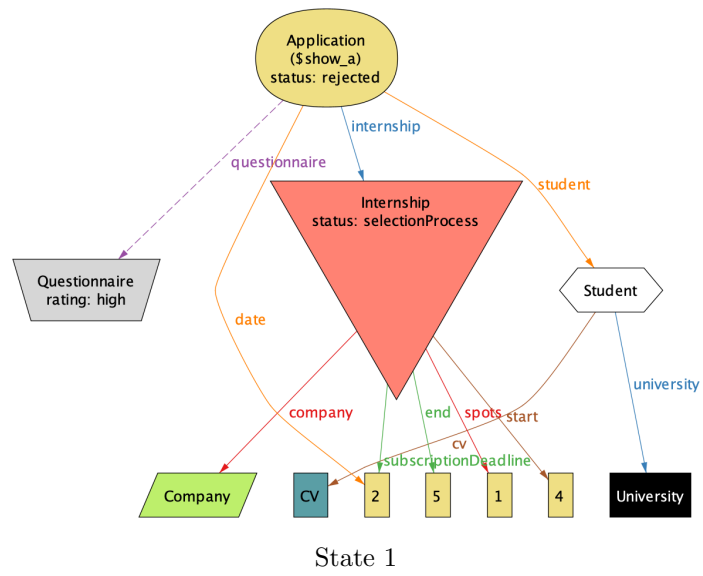

### 4.3.2 Second example

```

1 // Verifying that internships with not enough students don't
  start
2 pred show [] {
3     #Student = 1
4     #Company = 1
5     #Internship = 1
6     #Application = 1
7     some a: Application | a.status = pending and after a.
      status = rejected
8     one i: Internship | i.spots = 1
9 }
10
11 run show for 10

```

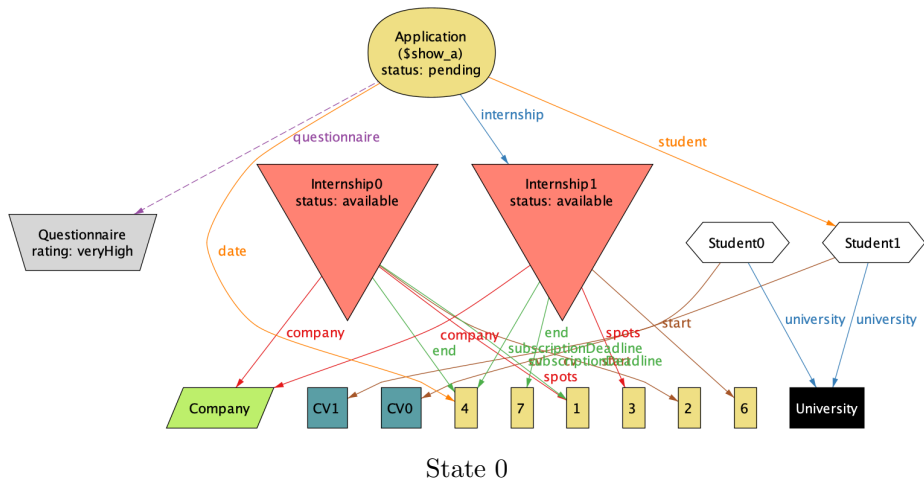

### 4.3.3 Third example

```

1 // Verifying that there can be a more complex situation, with
2   students without applications and internships without
3   applications
4 pred show [] {
5   #Student = 2
6   #Company = 1
7   #Internship = 2
8   #Application = 1
9
10  some a: Application | a.status = pending and after a.
11    status = selected
12 }
run show for 10

```
